Abdul Rehman (2303.KHI.DEG.035)

Arshad Shiwani (2303.KHI.DEG.026)

(1) Sphinx command line command:

```
sphinx-apidoc -o <output_dir> <module_dir> [exclude_patterns] [options]
```

sphinx-apidoc: is a Sphinx command-line tool used to automatically generate API documentation from Python modules.

<output_dir>: It is the directory where the generated documentation files will be saved.

<module_dir>: It is the directory containing the Python modules that you want to document.

[exclude_patterns]: It allows you to specify patterns and It helps you specify which files or folders should not be included in the generated documentation.

[options]: refers to additional command-line flags or parameters that can be used with the `sphinx-apidoc` command. These options allow you to customize the behavior of the documentation generation process.

Examples of commonly used options include

-f: forces the regeneration of all files, regardless of their existing status.

-e: generates separate files for each module instead of combining them into one file.

(2) flag that should be use for implicit namespaces in project.

`--implicit-namespaces`
